When I was about 6 or 7, my father purchased an HP Desktop. On it, my mom downloaded a game called “Bud Redhead” which I played very often. This is the earliest memory I have of technology only because it was the first game that I finished. My sister would often watch me play because she thought I was good at it. Although I didn’t really know how to work the computer for anything other than games, it came somewhat easy to me.

In eighth grade, I got a Microsoft surface rt tablet, which was the first technology that I had used for education. Although I had this device, I never really practiced with it. I only used it for applications such as Microsoft word or to work on google chrome. When it comes to using applications, I think I am the average user but when it comes to anything other than opening an application, I know nothing. The reason I took this class is to deepen my knowledge on how computers work and learn the cool things I can do with computers.

Because of K201, I know that technology is crucial for economic progress and business. I also know that computer science is significant in determining whether or not you are suitable for a job. This is because many jobs use technology to be effective. Apart from this basic information, I don’t know much about why technology is so crucial in the workplace.

My roommate recommended this class to me, describing the main components of the course. Mainly, I would like to learn how to code so that I can create applications and websites. This is something I am not currently able to do, so I hope I can learn how to do it in this class.
