The article I decided to use is titled “Social media means someone is always watching”. This article breaks down what essentially is going to be the future of our world in regards to technology. A lot of people see social media as a fun way to interact and connect, what people don’t usually see is that lack of privacy that comes with the internet. No matter what you do, shop for shoes, look for a car, chat on Facebook, your steps will be followed and documented automatically. The internet is getting very sophisticated which in some ways is a great thing but others not so good. This issue is starting to become more and more relevant today as it seems like we are introduced to a new article everyday reporting the misuse of social media. Whether it’s a kid shouting a racist chant or an athlete tweeting inappropriate content, the internet is a dangerous place. These events we keep seeing are not new. Before the internet there were still racist chants, still celebrities making idiotic comments, and kids making a fool out of themselves, the only difference is now everything is documented and shared at a global level. Before you could get away with what seems like petty issues but now, you post one somewhat questionable video and everyone on the globe with an internet connection can find it.

For the future, this will only get worse. You can literally buy a drone with cameras attached at your local Apple store. In my opinion, I think the future is somewhat scary because of the fact that there will be absolutely no privacy at all. Everything you do will be seen and documented, which leaves a very small margin of error. As we learn more and more about programming, it only introduces us to the science of how all this data is used and stored which will end up giving us a better idea of how to be safe with the internet as it advances.
