This lab will give you practice problem solving, algorithm design and code writing.

1) First do the three step analysis to solve problem where user enter three numbers and then calculates and displays the average of those three numbers.

2) Then write an algorithm that solves this problem. Once algorithm is done need to show me before go on.

3) Next take the algorithm and convert it to a console application and enter program to run it. Make sure have Option Strict and Option Explicit both ON. Need to capture your output and pace to bottom of your source code and make sure your name is at the top of program. When done print it off to show me. Don’t forget to make your name and outputs comments.
