Eli Lily

Eli Lily is a company that manages different medicines and is constantly trying to improve them in any way that they can. The company was started in 1876 by Colonel Eli Lily. He was a pharmacist who was always looking for new ways to improve medicine. He used his abilities to create a company that allowed for innovation and creativity. Eli Lily offers a wide variety of jobs, especially in the technology department. The company is extensive which allows for the need for a variety of technological jobs to keep the company moving smoothly.

Some of the jobs that I found to be interesting were the EDI specialist and Data Analyst-IT. The EDI specialist is responsible for the exchange of information. They translate the data into a standard format so that people outside of the technological field will be able to interpret the data and carry out their duties. The Data Analyst IT person is responsible for system and data integration solution delivery. They have to make complex systems that are able to document the flow of the data that is being received.

IBM

IBM is a cybersecurity company that helps to protect the identity of not only the everyday person but also other high up clients such as banks. Working with the internet is always interesting because innovation is constantly happening. This company was started in 1911 under another name but was soon changed to IBM in 1924. IBM is constantly looking for new ideas they can implement to their product. They held the record for the most patents registered by a business for several years.
IBM has jobs for all sorts of people who may be searching, including those who may still be pursuing a college diploma. One job that stood out to me was that of a visual designer. In this company, a visual designer has the job of designing and coding the interface and visual design solutions for the company.

Questions

1. Will there be additional training required for the job?
2. What degrees are most preferred for this industry?
3. Are there opportunities to advance in the company?

Job Research

A User Interface Designer is responsible for making sure the interface is designed well and looks appealing as well as making sure that it is able to function properly. I find this job to be interesting because it allows you to work with the area of design as well as still being able to solve problems that may come up within the system. This job intrigues me because it allows one to be creative all while still focusing on the technological aspect of the job.

I think I would be interested in some kind of programming job. Programming allows for a range of different jobs because practically every industry requires someone to code their programs. Since beginning this class, I have really liked the coding aspect and could really see myself becoming a programmer of some sort in the future.
